EDUCATION

Florida International University

Miami, FL

Bachelor of Science in Computer Science

Expected Summer 2027

- **Awards:** Bright Futures Medallion Scholarship
- **Relevant Coursework:** Java Programming 1 & 2, Data Structures & Algorithms, Algorithm Techniques, Operating Systems, Software Engineering, Software Testing, Discrete Structures, Physics
- **Organizations:** INIT | Ignite Student Mentor | AWS Student Builders

CERTIFICATIONS

AWS Academy Graduate: Cloud Foundations | *AWS Academy*

Sep. 2026

Java Programming II MOOC | *University of Helsinki*

Apr. 2024

Java Programming I MOOC | *University of Helsinki*

Mar. 2024

Blockchain and Cryptocurrencies: Applications & Technical Principles | *FIU*

Dec. 2022 – May 2023

TECHNICAL SKILLS

Languages: Java, JavaScript, HTML/CSS

Frameworks: Spring Boot

Developer Tools: Git, GitHub, VS Code, Figma

Databases & Cloud: PostgreSQL, H2, Heroku, AWS

Backend & APIs: REST APIs, HTTP/HTTPS, Cookie/Session-based Authentication, LLM Integration (Claude, Gemini, Grok)

PROJECTS

Aviary | *Spring Boot, PostgreSQL, HTML/CSS/JS, Thymeleaf*

Live | GitHub

- Built a Spring Boot maintenance tracker (14 endpoints, 4-table PostgreSQL schema) flagging service due by date or engine hours
- Secured multi-user data with Spring Security, BCrypt, CSRF protection, and ownership checks blocking cross-account access (403)
- Built a 1,400-line vanilla-JS dashboard with drag-to-reorder rows, 500ms debounced auto-save, and range-merging that prevents double-counted flight hours
- Automated a JDK 21 GitHub Actions pipeline that builds, tests, and auto-deploys to Heroku; load-tested with a 4,000-user JMeter plan

Deadhead | *Java 21, Spring Boot, PostgreSQL, Anthropic API*

Live | GitHub

- Built a Spring Boot backend service that persists charter flight scheduling state to PostgreSQL, modeling a week of flying as a solvable graph of (plane location, pilot location, time, trips remaining) states
- Implemented Dijkstra's algorithm as the service's scheduling engine: a priority queue and best-cost map over that state graph, skipping stale frontier entries and pruning states that can no longer complete their remaining trips in time
- Modeled states as Java records for automatic `equals/hashCode` deduplication of revisited situations, with a sealed `Action` interface so the compiler enforces exhaustive handling of every move type
- Integrated the Anthropic API server-side to parse free-text calendar events into structured trip data, falling back to airport-code matching when no key is configured

RapidAid | *AWS Amplify, Cognito, AppSync/DynamoDB, React, Gemini API*

Live | GitHub

ShellHacks 2025

Sep. 2025

- Shipped in 36 hours with a 4-person team a web app that auto-classifies disaster aid requests into medical, food, shelter, or water categories using the Google Gemini API's NLP
- Re-architected the app solo after the hackathon onto AWS Amplify Gen 2 (Cognito auth, AppSync GraphQL, DynamoDB), running Gemini categorization server-side in a Lambda so the API key never reaches the browser
- Owned the AI integration and request-classification pipeline, coordinating modular component handoffs with teammates under hackathon time pressure
